

ISOLAZ™ NEW BREAKTHROUGH ACNE and MELASMA TREATMENT

Rated as one of the three hottest products at the 2007 American Academy of Dermatology conference, Isolaz™ is powered by a breakthrough technology called Photopneumatics™ which is the only therapy in the world that combines a vacuum and painless broadband light to deep cleanse and purify your pores from the inside out. In a published clinical study, an astounding 100% of patients noted Aesthera Photopneumatic™ treatments were painless. Clinical studies by leading dermatologists have proven the effectiveness of Isolaz™ Photopneumatic technology for acne, and effectiveness is even greater when added to traditional dermatologist prescribed acne treatments.

The combination of a painless gentle pressure vacuum and laser light helps remove the blockages in the pores including blackheads, dirt, oil, dead cells and other debris which helps result in radiant, clear skin that is purified from the inside out. The vacuum helps loosen and extract dirt, blackheads and excess oil from deep within your pores. The light destroys acne causing bacteria, and can help even out skin tone.

Isolaz™ Photopneumatic™ therapy is up to seven times faster than traditional light-based treatments so you can have them done during lunch! Full face treatments can be completed in approximately ten minutes. Full back treatments can be done in approximately twenty minutes.

Isolaz™ therapy is effective on all skin types and is the only FDA cleared system to treat pustular and comedonal acne as well as mild to moderate acne vulgaris. Unlike other acne light treatments, the Isolaz™ system does not cause sensitivity to light. Isolaz™ treatments are relaxing and do not include side effects such as redness, crusting or other common post-treatment discomforts. With Isolaz™ therapy, you can go right back to your normal activities immediately post-treatment.

Everyone's skin is different but studies have shown that 85% of people who have an Isolaz™ treatment will experience clearer skin. Many patients notice an improvement in their skin after only one treatment. Typical treatment regimens are weekly for four weeks, however, the exact number of treatments varies from patient to patient. Sunscreen and a retinoid should be used for several weeks the treatments to optimize results.

An additional treatment available with the ISOLAZ™ is PROFUSION facials. By using the vacuum to pick up and stretch the skin cells, we can increase the perfusion of chemicals into the top layer of the skin in a way that has never been available before. For melasma or the "mask of pregnancy" (which also happens when women take birth control pills), we can increase the penetration of bleaching agents and get dramatic improvement in just a few treatment sessions. The use of epidermal growth factors with the vacuum creates a truly beneficial facial with immediately visible results.
